### **Active Weather Warnings, Watches and Advisories by County:**

## **WEATHER SYNOPSIS BY REGION**

#### **NORTHERN CALIFORNIA**

Changeable weather due to trough and ridge interactions will continue the next 7 to 10 days. Some precipitation chances will exist but significant wetting amounts are not anticipated across the Northern California region.

Post cold frontal passage conditions will occur today with lower humidity levels and residual gusty northerly and easterly winds this morning. Wind speeds will lower considerably this afternoon. An inside slider like shortwave passage will occur Wednesday into Wednesday night. Precipitation, albeit light, will be relegated to the far north and east. Moderate levels of N-NE and eventually E winds will develop behind the wave passage and affect the area Wednesday night into Thursday. Expect peak gusts to 35 mph in the gap wind prone areas found along the west slopes of the Cascade and Sierra ranges as well as the Sacramento Valley and adjacent highlands to the west.

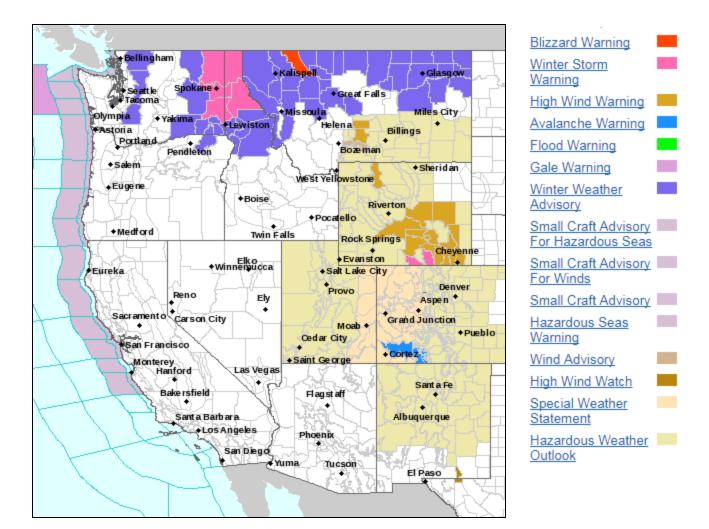

Ridging with drier and warmer conditions will develop on Friday. The ridge is expected to flatten some over the region during the weekend. Weather models are trending a bit drier for the weekend period which means the pattern looks to be more and more like an inside slider. This entails small chances of precipitation across the far north and east and an eventual cool intrusion and gusty northerly winds. Additional inside slider like systems of varying degree are expected next week.

#### **SOUTHERN CALIFORNIA**

A low pressure area currently off the Central California Coast will push inland across Southern California Wednesday bringing near normal temperatures and humid conditions to the area. This low pressure area will be followed by a trough coming down from Canada which will cause there to be little change in the weather Thursday. Maximum temperatures will be in the 40s to low 50s across the mountains and upper 50s and 60s in the valleys through Thursday. Minimum humidity will be mainly above 30% through Thursday. These two systems have little in the way of moisture so only isolated showers will be possible. The snow level will be around 6,000 feet. A weak ridge of high pressure will build into California from the Pacific Ocean which will warm temperatures to 5 to 10 degrees above normal Friday and Saturday. Minimum humidity will drop mainly into the teens Friday and Saturday. Northeast winds of 15 to 25 mph with gusts to 40 mph will surface across the mountains and below the canyons and passes of Southern California Thursday night through Friday morning. Another trough will drop south from Canada which will bring significant cooling along with a big increase in humidity Sunday through early next week. At this time, it does not look as though this trough will have much moisture associated with it and only isolated light showers will be possible.
